Analytical methods such as the preceding ones are elegant and relatively easy to use, but they are restricted in their applicability by the validity of the assumptions used to derive the equations. The two most restrictive assumptions concern the zero-order kinetics and the lack of remineralization.

Methods in biochemistry. Like other sciences, biochemistry aims at quantifying, or measuring, results, sometimes with sophisticated instrumentation. The earliest approach to a study of the events in a living organism was an analysis of the materials entering an organism (foods, oxygen) and those leaving (excretion products, carbon dioxide). This is still the basis of so-called balance experiments conducted on animals, in which, for example, both foods and excreta are thoroughly analyzed.

Analytical Techniques in Biochemistry and Molecular Biology

The biochemistry utilizes in practice a whole series of methods and laboratory techniques to meet quantitative and qualitative insights into biochemical processes. Main areas here are the isolation, purification and characterization of biomolecules, analytical and test methods, structure determination, etc. The individual methods are used not only in biochemical research, but also in areas such as clinical chemistry, lipidomics, histology, proteomics, and many others.
