Applying the boundary conditions gives,  $0 = y(0) = c_1 \cdot 0 = c_2 \sin(2\sqrt{3}\pi) \Rightarrow c_2 = 0$   
 $0 = y(2\pi) = c_1 \cdot 0 = c_2 \sin(2 \cdot 3\pi) \Rightarrow c_2 = 0$ . In this case we found both constants to be zero and so the solution is,  $y(x) = 0$ . In the previous example the solution was  $y(x) = 0$ .

Boundary value problems arise in several branches of physics as any physical differential equation will have them. Problems involving the wave equation, such as the determination of normal modes, are often stated as boundary value problems. A large class of important boundary value problems are the Sturm–Liouville problems. The analysis of these problems involves the eigenfunctions of a ...

In mathematics, in the field of differential equations, a boundary value problem is a differential equation together with a set of additional constraints, called the boundary conditions. A solution to a boundary value problem is a solution to the differential equation which also satisfies the boundary conditions.

Publisher Summary. This chapter discusses the integrals of the Cauchy type. In solving boundary value problems connected with other differential equations, generalized potentials of various types are employed. For the solution of the boundary value problems of the theory of analytical functions of complex variable, the analogous device is constituted by the integral of the Cauchy type and its various

An important role in the theory of boundary value problems is played by the concept of the index of the problem — an integer defined by the formula  $\kappa = 2(m + n)$ , where  $2\pi n$  is the increment of  $\operatorname{arg} \overline{a_m}(t)$  under one complete traversal of the contour  $L$  in the direction leaving the domain  $S^+$  at the left.

These type of problems are called boundary-value problems. Most physical phenomena are modeled by systems of ordinary or partial differential equations. Usually, the exact solution of the boundary value problems are too difficult, so we have to apply numerical methods.

We discuss univalent solutions of boundary fractional differential equations in a complex domain. The fractional operators are taken in the sense of the Srivastava-Owa calculus in the unit disk. The existence of subsolutions and supersolutions (maximal and minimal) is established. The existence of a unique univalent solution is imposed.
