Bull Semen Collection And Analysis For Artificial Insemination

Semen is most commonly collected from bulls in bull studs using an artificial vagina, as described below. Electroejaculation is an alternative method used with bulls that cannot mount or are too fractious for easy handling (e.g. range bulls). Finally, semen can be collected by massage of the seminal vesicles and ampullae per rectum.

fertility of a male and provide diagnostic information in cases of infertility. Semen has been collected from a very large number of creatures. In dairy cattle, chickens and turkeys, semen collection, processing and insemination is a large industry, and has been indispensable in genetic improvement programs.

Collection and Evaluation of Semen
Semen collection for the purpose of reproductive evaluation or for use in artificial insemination is widely practiced in modern horse breeding. Although semen collection can be performed on jump mares, the standard accepted method is to train the stallion to mount a phantom, or dummy. Stallions can be readily trained to serve the artificial vagina.

Storage & Distribution

The semen collected via electroejaculation is not representative of a full ejaculate in regard to volume and concentration, and thus the sperm production potential of the bull is based on the evaluation of SC.

Conversely, sperm quality (motility and morphology) does not differ from that in an ejaculate collected with an AV.
