Abstract A paper which purports to make a comparison between finite difference and finite element methods is doomed to be met with much criticism. The reason for this inevitable fate is that a study such as this must contain a high degree of subjectivity which many readers will have cause to disagree with.

To easier compare this result to the finite element approach to approximating functions, we can rewrite the left-hand side of as $\frac{1}{6}(u_{i-1} - 2u_i + u_{i+1})$ Thinking in terms of finite differences, we can write this expression using finite difference operator notation:

The finite element method (FEM), or finite element analysis (FEA), is a computational technique used to obtain approximate solutions of boundary value problems in engineering. Boundary value problems are also called field problems. The field is the domain of interest and most often represents a physical structure.

Two methods for finite element reliability analysis involving random fields are reviewed and compared. One method is based on a direct coupling of finite element and reliability codes, and the other involves post-processing of results obtained from the SSFEM. The paper critically evaluates the purported potential of SSFEM for reliability analysis.

Abstract: We have studied a few simple demagnetization models, which are quick and easy to implement in finite-element calculations, and compared them with measured recoil behavior of Nd-Fe-B magnet material, also using a hysteresis model for comparison. The models are used to estimate post-demagnetization performance of an overloaded surface magnet synchronous machine.
