Emulsion Formation Crude oil is usually, but not always, associated with water. During the process of its retrieval from the production zone, the produced fluid undergoes a significant amount of agitation. It is this agitation combined with heat, pressure, and chemicals present in the crude that act to produce emulsions.

The goal of this article is to test the potential application of lignosulfonates (LSs) in crude oil production and processing. Three LS samples of varying hydrophobicity and average molecular weight were considered. First, the interfacial tension between brine and xylene and interfacial dilational rheology properties of LS samples were measured. It was found that the most surface-active LS ...
