Dell EMC Data Domain Boost (DD Boost) is Dell EMC software that can be used with the gpcrondump and gpdrestore utilities to perform faster backups to the Dell EMC Data Domain storage appliance. Data Domain performs deduplication on the data it stores, so after the initial backup operation, the appliance stores only pointers to data that is unchanged.

During the backup operation, the DD Boost storage plugin replicates the backup set on the remote Data Domain system with DD Boost managed file replication. To restore data from a replicated backup, you can use gprestore with the DD Boost storage plugin and specify the location of the backup in the DD Boost configuration file.

Introduced in DD OS 6.0, the DD Boost File System Plug-In (BoostFS) resides on the application system, presenting a standard file system mount point to the application. With direct access to a BoostFS mount point, the application can leverage the storage and network efficiencies of the DD Boost protocol for backup and recovery.

Boost (DD Boost) for Oracle Recovery Manager (RMAN) or the RMAN plug-in. In version 4.0, the product name changed to Oracle RMAN agent. Audience This guide is for system administrators who are familiar with Oracle backup applications and general backup administration. Revision history The following table presents the revision history of this document.

~~Dell EMC Oracle RMAN Agent~~

The DD Boost plugin integrates with RMAN as a tape library sub-system. Instead of performing database backups directly to Data Domain (as a directory path), the RMAN backup is taken to a tape channel. RMAN streams the backup through the DD Boost plugin to the backend Data Domain. How DD Boost Speeds Up Your Backup

~~Configuring DD Boost | HoB~~

What is Data Domain (DD) Boost? Simply put DD Boost is software that enhances how backup servers and clients interact with a Data Domain backup appliance. It is based on Symantec's OST (Open Storage Technology) protocol, and is a means to extend Data Domain features back to the source. This API integration adds three distinct benefits:

~~EMC Data Domain Boost: What is it and Why it's Beneficial~~

Yes, both master and media server will use DD-Boost over FC for backup. Which DD Component will they have the common visibility so they can read simultaneously (e.g will it be disk pool or Storage server or something?) ... I find the following from the vault admin guide under the disk pool section of "choose backups": Note: An individual disk ...

~~Solved: NetBackup with DD Boost - VOX~~

In certain environments, a database administrator or application owner can monitor backups and restores with DDBOOST for Enterprise Applications (DDBEA) on the application host. The DDBEA agent integrates with the applications native management utility for efficient backups from the application host to the Data Domain using DDBOOST.

~~Data Domain Boost for Enterprise Applications~~

The DD Boost administrator guide recommends using windows task scheduler to execute these commands and manage backup and restore jobs. This presents an issue for many DBA's because they have a much greater set of functionality in the SQL Agent job engine.

~~Data Domain Boost for SQL - Deployment Planning ...~~

To enable DD Boost in the DD System Manager, follow these steps: Select Data Management > File System > Enable to enable the file system. Note: DD Boost is an optional product. A separate license is required to operate DD Boost software on the Data Domain system. Select Administration > Licenses > Update Licenses to upload the DD Boost license.
