A cylinder head is a structure which accompany important engine parts like inlet valve (4 Stroke), Exhaust valve and fuel injector. They are exposed to maximum temperature and pressure so provided with adequate cooling arrangement. They sit on top of the liner flange and secured with a series of nut and bolts with the cylinder block.

Diesel combustion. The diesel engine is an intermittent-combustion piston-cylinder device. It operates on either a two-stroke or four-stroke cycle (see figure); however, unlike the spark-ignition gasoline engine, the diesel engine induces only air into the combustion chamber on its intake stroke. Diesel engines are typically constructed with compression ratios in the range 14:1 to 22:1.

Yes, this is true that the lead-acid batteries are the most useful components in a diesel engine and they play a vital role in starting the engine. Lead-acid batteries give power to the starter motor, and the electric starter motor cranks the engine through flywheel to ignite the engine.

11 Common Problems Faced by Diesel Engines

Dirty fuel filters, loose throttle linkage, excessive lubrication, and issues with the fuel injectors can lead to this issue. 6. Failing Lead-Acid Storage Batteries. There's often a heavy load on the lead-acid storage battery, which is a useful component in the engine's starter system.

However, diesel engine parts have to be made much stronger than their petrol engine equivalents because of the much higher loads involved. The walls of a diesel engine block are normally far thicker than a block designed for a petrol engine, and they have more bracing webs to provide extra strength and to absorb stresses. Apart from being stronger, the heavy-duty block can also reduce noise more effectively.

The two main parts needing oil are the pistons (so they can slide easily in their cylinders) and any bearings that allow things like the crankshaft and camshafts to rotate freely. In most cars, oil is sucked out of the oil pan by the oil pump, run through the oil filter to remove any grit, and then squirted under high pressure onto bearings and the cylinder walls.

How Car Engines Work | HowStuffWorks

This means that fuel (usually gasoline or diesel) is burned or combusted to make the parts of the car move which propel it along. The cylinder head is an engine part which is constructed of various materials, depending on the model: often cast iron or aluminium alloy. The function of the cylinder head is to seal the top of the engine cylinders.
