About this course. 6.341x is designed to provide both an in-depth and an intuitive understanding of the theory behind modern discrete-time signal processing systems and applications. The course begins with a review and extension of the basics of signal processing including a discussion of group delay and minimum-phase systems, and the use of discrete-time (DT) systems for processing of continuous-time (CT) signals.

When a discrete-time signal is obtained by sampling a sequence at uniformly spaced times, it has an associated sampling rate. Discrete-time signals may have several origins, but can usually be classified into one of two groups: By acquiring values of an analog signal at constant or variable rate. This process is called sampling. By observing an inherently discrete-time process, such as the weekly peak value of a particular economic indicator. Continuous time

\u2022 In its most general form, DSP refers to the processing of analog signals by means of discrete-time operations implemented on digital hardware. \u2022 From a system viewpoint, DSP is concerned with mixed systems: - the input and output signals are analog - the processing is done on the equivalent digital signals.

Discrete Time Signal Processing

Course Description. This class addresses the representation, analysis, and design of discrete time signals and systems. The major concepts covered include: Discrete-time processing of continuous-time signals; decimation, interpolation, and sampling rate conversion; flowgraph structures for DT systems; time-and frequency-domain design techniques for recursive (IIR) and non-recursive (FIR) filters; linear prediction; discrete Fourier transform, FFT algorithm; short-time Fourier analysis and ...

In signal processing, sampling is the reduction of a continuous-time signal to a discrete-time signal.A common example is the conversion of a sound wave (a continuous signal) to a sequence of samples (a discrete-time signal).. A sample is a value or set of values at a point in time and/or space. A sampler is a subsystem or operation that extracts samples from a continuous signal.

A (one-dimensional) discrete-time signal is defined as a sequence of numbers, written as $x[n]$, with $n \in \mathbb{Z}$. It is written with square brackets to clearly differentiate it from a continuous signal $x(t)$, with $t \in \mathbb{R}$. Often, the discrete-time signal is a sampled version of a \u2022real\u2022 continuous signal.
