This one-of-a-kind book brings together the broad knowledge nurses need to be confident in cardiovascular care, including cardiovascular anatomy and physiology; assessment; diagnostic testing; hemodynamic monitoring; electrocardiogram performance and interpretation; medications; synchronized cardioversion; care of patients with IABP counterpulsation, ICDs, pacemakers, and VADs; and preoperative and postoperative care for patients with MIDCAB, CABG, and balloon angioplasty.

Presents information logically, based on the pathophysiology of disease, significance of evidence, and avoidance of harmful effects inherent at the critical care level of nursing practice. Chapters include critical care basics, holistic care issues, body system-based conditions, and hematologic,

immune and multisystem disorders. This new edition is completely updated to incorporate the spectrum of critical care and evidence-based nursing practice, ranging from moderate sedation and perianesthesia management to special concerns for patients who are elderly, the types of shock, management of stroke, and more.

The new edition of this book covers fluid-filled systems, intracranial hemodynamics, open-heart surgery patients, pediatric patients, and more! It shows exactly how to insert and manipulate catheters safely, read monitors properly and interpret readings accurately. Precise illustrations deliver crucial details on delicate techniques. The latest edition has been thoroughly updated and revised incorporating all the new techniques and procedures. Includes precise illustrations which depict crucial details on delicate techniques Thoroughly updated and revised incorporating all the new techniques and procedures Includes coverage of fluid-filled systems Intracranial hemodynamics is discussed Treatment details for open-heart surgery patients and pediatric patients is also included

This book describes the pathophysiological significance of the hemodynamic monitoring parameters available to the clinician and their role in providing reliable and reproducible information on the

cardiocirculatory status of a patient in shock. It is explained how measurements of these parameters enable the intensivist to understand the patient's condition and to make more informed treatment decisions in order to optimize the hemodynamic status and improve the prognosis. Full guidance is provided on measurement of intravascular blood pressures, cardiac output, and derived variables. Methods of cardiac output determination based on the classical pulmonary thermodilution, transpulmonary thermodilution, echocardiography, and Doppler techniques are reviewed. Techniques based on calibrated and non-calibrated pulse contour analysis are discussed, with attention to their limitations. Furthermore, the dynamic indices of fluid responsiveness, their clinical applications, and issues related to their use are addressed. Care is also taken to explain the physiological concepts underlying various devices used by anesthesiologists and intensivists.

ECG Interpretation Made Incredibly Easy makes learning to read and interpret rhythm strips simple. The book reviews fundamental cardiac anatomy and physiology, explains how to obtain and interpret a rhythm strip, and teaches the reader how to recognize and treat sinus, atrial, and ventricular arrhythmias, as well as heart blocks. In addition, the

book explains how to obtain and interpret 12-lead ECGs. Each chapter features: a summary of key points; clear, simple explanations of problems; definitions of key terms; illustrations that clearly explain key concepts; bullets, ballot boxes, and checklists that make it easy to spot important points at a glance; sidebars that highlights key facts about ECG interpretation; and quick quizzes to test knowledge.
