Production Efficiency Definition

The production frontier model without random component can be written as:  $y_i = f(x_i; \beta) \cdot TE_i$  where  $y_i$  is the observed scalar output of the producer  $i$ ,  $i=1, \dots, I$ ,  $x_i$  is a vector of  $N$  inputs used by the producer  $i$ ,  $f(x_i, \beta)$  is the production frontier, and  $\beta$  is a vector of technology parameters to be estimated.

The level of frontier production increases, but the rate of technical progress decreases, leading to a fall in frontier production. Efficiency also falls, lending support to the idea that recessions tend to reduce, rather than increase, economic restructuring. Long and deep recessions are also shown to have distinctive impacts on productivity.
