To obtain enthalpy values in liquid phase of ammonia–water mixture the enthalpy-concentration diagram was used (Costa, 1976) in case of graphical representation of enthalpies of solutions of different concentrations at constant temperature for different pressures. A corresponding temperature range between - 40 ° C and 80 ° C was used for development of these calculations.

In aqueous solution, ammonia deprotonates a small fraction of the water to give ammonium and hydroxide according to the following equilibrium :  $\text{NH}_3 + \text{H}_2\text{O} \rightleftharpoons \text{NH}_4^+ + \text{OH}^-$ . In a 1 M ammonia solution, about 0.42% of the ammonia is converted to ammonium, equivalent to  $\text{pH} = 11.63$  because  $[\text{NH}_4^+] = 0.0042 \text{ M}$ ,  $[\text{OH}^-] = 0.0042 \text{ M}$ ,  $[\text{NH}_3] = 0.9958 \text{ M}$ , and  $\text{pH} = 14 + \log_{10} [\text{OH}^-] = 11.62$ .

$\text{SG}_f$  = specific gravity of final concentration aqua ammonia  
 $\text{SG}_w = 1.0000$  specific gravity of water. Two laws are clear: First, the weight of the original anhydrous ammonia or aqua solution plus the weight of the water added must equal the weight of the final solution. Second, the weight of the ammonia ( $\text{NH}_3$ ) present originally (either as anhydrous ammonia or in the original aqua ammonia) must equal the weight of the ammonia

Ammonia (data page) - Wikipedia

Ammonium nitrate is the solid used in this example, and water is the liquid because of the industrial importance of aqueous solutions. Vapor pressures were carefully determined experimentally, and the enthalpy chart was developed from the straight lines of the logarithmic plot and available heat data. Constants for the vapor pressure curves for ammonium nitrate solutions and equations for enthalpies of solid ammonium nitrate are given for the temperature range 0 ° to 170 ° C.
