If any neuron in a layer (for instance, the layer of hidden units) is connected to a neuron in another layer (say, the output layer), then each hidden unit is connected to every output neuron. The arrangement of neurons into layers and the connection patterns within and between layers is called the net architecture.

Around 2^n (where n is the number of neurons in the architecture) slightly-unique neural networks are generated during the training process, and ensembled together to make predictions. A good dropout rate is between 0.1 to 0.5; 0.3 for RNNs, and 0.5 for CNNs. Use larger rates for bigger layers.

Fundamentals of Neural Networks on Weights & Biases

Natural Neural Networks. • Signals “ move ” via electrochemical pulses, combination of electrical signals and chemical signals working together. • A neuron receives input from other neurons (maybe hundreds or even thousands) from its synapses. • The synapses release a chemical transmitter – the sum of which can cause a threshold to be reached – causing the neuron to “ fire ” .
