While the Internet is a relatively new technology, that has impacted the world, and provided many benefits, it has also had negative ramifications. Individuals unable to control their use are jeopardizing school, employment and relationships. The concept of “ Internet Addiction ” is used to explain uncontrollable, damaging use of technology. It is characterized as an impulse control disorder, comparable to pathological gambling, because of overlapping diagnostic criteria and symptomatology. Based on these studies, the IAT was constructed to capture the problematic behavior associated with compulsive use of technology, including online porn, internet gambling and compulsive use of online games and social media. The Internet Addiction Test emerged as the first validated measure of Internet and technology addiction. The assessments can be administered in a variety of mental health settings, including private practice clinics, schools, hospitals and residential programs. They can be used when there is suspicion of Internet addiction, as part of a broad intake assessment, or for use in a wellness curriculum to help participants evaluate their own Internet behavior. The IAT can also be a valuable pre-employment screening device, to detect internet addiction among job candidates, to improve productivity and reduce corporate liability. Based on 20 self-report items, the IAT assesses for the presence of addiction to the Internet, electronic entertainment, social media, and general use of electronic devices, and also measures the severity of addiction, in terms of mild, moderate or severe. Furthermore, because Internet addiction may be driven by different reasons and manifest in different ways, requiring different types of treatment, the IAT produces scores related to the following areas: EscapeCompulsionNeglecting dutiesAnticipationLack of ControlSocial Avoidance

the University of Pennsylvania and the Annenberg Foundation Trust at Sunnylands Trust, *Treating and Preventing Adolescent Mental Health Disorders*, Second Edition, provides a major update since the first edition in 2005. It addresses the current state of knowledge about the major mental health disorders that emerge during adolescence, including updated DSM-5 diagnostic criteria. Here, six commissions established by the APCC and the Sunnylands Trust pool their expertise on adolescent anxiety, schizophrenia, substance use disorders, depression and bipolar disorders, eating disorders, and suicidal behavior in sections that thoroughly define each disorder, outline and assess available treatments, discuss prevention strategies, and suggest a research agenda based on what we know and don't yet know about these various conditions. Two additional behavioral disorders--gambling and internet addiction--are covered in this second edition. As a meaningful counterpoint to its primary focus on mental illness, the volume also incorporates the latest research from a seventh commission--on positive youth development--which addresses how we can fully prepare young people to be happy and successful throughout their lives. Concluding chapters discuss overarching issues regarding the behavioral and mental health of adolescents: overcoming the stigma of mental illness, the research, policy, and practice context for the delivery of evidence-based treatments, and the development of a more robust agenda to advance adolescent health. Integrating the work of eminent scholars in both psychology and psychiatry, this work will be an essential volume for academics and practicing clinicians and will serve as a wake-up call to mental health professionals and policy makers alike about the state of our nation's response to the needs of adolescents with mental disorders.
