Mollusks include snails, clams and squids while arthropods include spiders, mites, scorpions, shrimps, crabs, lobsters, insects, etc. Moreover, their anatomical structure for locomotion too adds to the difference between mollusks and arthropods. That is; unlike arthropods, some mollusk species have a muscular foot for locomotion.

Concepts of Biology is designed for the single-semester introduction to biology course for non-science majors, which for many students is their only college-level science course. As such, this course represents an important opportunity for students to develop the necessary knowledge, tools, and skills to make informed decisions as they continue with their lives. Rather than being mired down with facts and vocabulary, the typical non-science major student needs information presented in a way that is easy to read and understand. Even more importantly, the content should be meaningful. Students do much better when they understand why biology is relevant to their everyday lives. For these reasons, Concepts of Biology is grounded on an evolutionary basis and includes exciting features that highlight careers in the biological sciences and everyday applications of the concepts at hand.We also strive to show the interconnectedness of topics within this extremely broad discipline. In order to meet the needs of today's instructors and students, we maintain the overall organization and coverage found in most syllabi for this course. A strength of Concepts of Biology is that instructors can customize the book, adapting it to the approach that works best in their classroom. Concepts of Biology also includes an innovative art program that incorporates critical thinking and clicker questions to help students understand—and apply—key concepts.

Annotation In an isolated pine forest on the eastern edge of Central Texas, there lies an island of abundant and diversified life known as the Lost Pines, the western-most stand of the loblolly pine. This 100,000-acre island includes portions of Bastrop and Buescher state parks. It was here that Stephen Welton Taber and Scott B. Fleenor encountered insect life of astonishing diversity. Setting out to identify and describe the insects and related animals most readily observed in the Lost Pines, they also discovered some hidden, rare, and never-before-described species. The result is this book, a bestiary of more than 280 species of invertebrates including insects, millipedes, centipedes, spiders, scorpions, mollusks, and worms. Each species description includes common and scientific names; information on biology, distribution, and similar species; and the authors' special remarks. The next time you visit Bastrop State Park, turn over a few logs, look at the ants, and don't swat the flies. Take along this newguide and open up a world of life in one of Texas' most unique and popular landscapes.
