The method of lines (MOL, NMOL, NUMOL) is a technique for solving partial differential equations (PDEs) in which all but one dimension is discretized. MOL allows standard, general-purpose methods and software, developed for the numerical integration of ordinary differential equations (ODEs) and differential algebraic equations (DAEs), to be used. A large number of integration routines have ...

The finite element method is a special method for the numerical solution of partial differential equations. The name was coined by engineers who used the method in structural mechanics. The finite element method became a very widely used method in practice. The theoretical investigation of different aspects began a few years ago.

Numerical Methods for Partial Differential Equations ...

In mathematics, a partial differential equation (PDE) is an equation which imposes relations between the various partial derivatives of a multivariable function. The function is often thought of as an "unknown" to be solved for, similarly to how x is thought of as an unknown number, to be solved for, in an algebraic equation like $x^2 + 3x + 2 = 0$.

Numerical methods for ordinary differential equations are methods used to find numerical approximations to the solutions of ordinary differential equations. Their use is also known as "numerical integration", although this term is sometimes taken to mean the computation of integrals. Many differential equations cannot be solved using symbolic computation. For practical purposes, however – such as in engineering – a numeric approximation to the solution is often sufficient. The algorithms ...

Numerical simulation of partial differential equations is far more demanding than that of ordinary differential equations. Also the diversity of types of partial differential equations precludes the availability of general purpose "canned" computer programs for their solutions.

The study on numerical methods for solving partial differential equation will be of immense benefit to the entire mathematics department and other researchers that desire to carry out similar research on the above topic because the study will provide an explicit solution to partial differential equations using numerical methods. The study will determine the norm and error norms in the numerical solution of the PDE.

Numerical Methods for Solving Partial Differential ...

This chapter discusses the numerical solution of linear partial differential equations of elliptic-hyperbolic type. It reviews the numerical methods for the solution of linear equations of mixed type. In the theory of partial differential equations, there is a fundamental distinction between those of elliptic, hyperbolic, and parabolic type.
