$i$ ; which is the chain rule for partial derivatives. Example. Take  $f(x;y;z) = x + e^{xyz} \sin z$ . Then  $\nabla f = \left( \frac{\partial f}{\partial x}; \frac{\partial f}{\partial y}; \frac{\partial f}{\partial z} \right) = (1 + yez \sin z; xez \sin z; exy \cos z)$  At  $(x;y;z) = (0;1;0)$ ,  $\nabla f = (1;0;1)$ . So  $f$  increases/decreases most rapidly for  $n = \sqrt{1^2 + 0^2 + 1^2} = \sqrt{2}$ .  $(1;0;1)$  with a rate of change of  $\sqrt{2}$ .

*Stephen J. Cowley: Teaching Resources*

Vector calculus, or vector analysis, is concerned with differentiation and integration of vector fields, primarily in 3-dimensional Euclidean space  $\mathbb{R}^3$ . The term "vector calculus" is sometimes used as a synonym for the broader subject of multivariable calculus, which includes vector calculus as well as partial differentiation and multiple integration. Vector calculus plays an important role in differential geometry and in the study of partial differential equati
