Reliability Analysis Applied On Centrifugal Pumps

This research article presents a methodology to identify the critical component of a centrifugal pump and analyze its reliability. Failure analysis of major components of the pump was done, risk priority number was calculated and critical component was identified. The critical component was considered to be composed of two sections.

Reliability Analysis Applied On Centrifugal Pumps

In the past, the reliability analysis of centrifugal pumps is usually performed by collecting a large amount of maintenance data for reliability analysis. For some failures of centrifugal pumps that are not very frequent, the corresponding maintenance data are also small. This paper proposes a reliability research analysis method based on the fact that the centrifugal pump has few maintenance data.

$RS = 0.95$. This calculation determines that the overall reliability of the system is .95 or 95%. This means that it has a 95% chance that there will be not be a failure that will take the entire system down during the mission time. This is due in large part to the redundancy built into the system on the pump trains.

Enhance Centrifugal Pump Reliability. Centrifugal pumps are common at many plants — Figure 1 shows a typical centrifugal pump and Figure 2 a complex multi-casing one for a high-pressure service. Unfortunately, plants often suffer unnecessary pump downtime. Operating conditions not mentioned in the pump order document and not considered in pump design and manufacturing account for more than 75% of all unscheduled shutdowns.
