By comparing the values obtained using Taylor's Series method and the above terms (I will spare you the details here), they obtained the following, which is Runge-Kutta Method of Order 2: $y(x+h) = y(x) + \frac{1}{2}(F_1 + F_2)h$ where $F_1 = hf(x, y)$ and $F_2 = hf(x+h, y+F_1)h$ Runge-Kutta Method of Order 3. As usual in this work, the more terms we take, the better the solution.

Examples for Runge-Kutta methods We will solve the initial value problem, $\frac{du}{dx} = 2u - x^4$, $u(0) = 1$, to obtain $u(0.2)$ using $h = 0.2$ (i.e., we will march forward by just one h). (i) 3rd order Runge-Kutta method For a general ODE, $\frac{du}{dx} = f(x, u)$, the formula reads $u(x+h) = u(x) + \frac{1}{6}(K_1 + 4K_2 + K_3)h$,

Runge-Kutta Method : Runge-Kutta method here after called as RK method is the generalization of the concept used in Modified Euler's method. In Modified Eulers method the slope of the solution curve has been approximated with the slopes of the curve at the end points of the each sub interval in computing the solution.

Runge-Kutta method

What is the Runge-Kutta 4th order method? Runge-Kutta 4th order method is a numerical technique to solve ordinary differential used equation of the form $\frac{dy}{dx} = f(x, y)$, $y(0) = y_0$. So only first order ordinary differential equations can be solved by using Rungethe -Kutta 4th order method. In other sections, we have discussed how Euler and Runge-Kutta methods are used to solve higher order ordinary differential equations or coupled (simultaneous) differential equations.
