I am doing a lot of reverse engineering on SOIC-8 Eeproms in automotive ecus. At the moment it requires unsoldering the chip, read/write, solder the chip back in, test, repeat. Most Eeproms have to be removed from the PCB in order to be read.

EEPROM programming for the user. When writing to the EEPROM there are two important guidelines to follow: •Only single byte writes are permitted, do not attempt multi-byte transfers •Wait 30ms between each EEPROM write These guidelines are followed automatically by the "Write EEPROM" function. 3.3 Verify EEPROM

ATmega328P - Microchip Technology

is a 25 MHz low power DDS device capable of producing high performance sine and triangular outputs. It also has an on-board comparator that allows a square wave to be produced for clock generation. Consuming only 13 mW of power at 3 V makes the AD9833 an ideal candidate for power-sensitive applications.

Alternatively, users can pre-program the blank EEPROM on a 3rd Party Universal Programmer before soldering the EEPROM onto the AX88179 application device. You MUST assign a unique MAC address in the EEPROM for every AX88179 device. Please refer to AX88179 EEPROM User Guide for more detailed EEPROM/eFuse design notes.

Debugging EEPROM applications It is easy to burn out a memory cell in few minutes, so during debugging it would be very useful to limit the number of allowed writes. It is easy to put a bracket at the wrong location, and placing an EEPROM write inside of a loop, rather than outside, and introduce extensive writing causing wear.
