The way to solve a linear equation is to rewrite it in such a form that on the one side of the equality sign we end up with one term only containing x , and on the other side we have one term which is a constant. To achieve this we can perform several operations. First of all we can add or subtract a number on both sides of the

result in a system of equations with no solutions? No solutions. So a system has no solutions is if both lines and these are both linear equations, they actually tell us these are linear equations, is if you have two lines that are parallel, then you have no solutions. They are never going to intersect.

A linear equation is an equation for a straight line. These are all linear equations: $y = 2x + 1$: $5x = 6 + 3y$: $y/2 = 3 - x$: Let us look more closely at one example: Example: $y = 2x + 1$ is a linear equation: The graph of $y = 2x + 1$ is a straight line . When x increases, y increases twice as fast, so we need $2x$;
