This study provides evidence that measures of taste sensitivity and PR for some types of taste are correlated. In particular, higher sensitivities to salt, sweet, and umami taste are associated with decreases in the preferences for these tastes whereas fat and sour preferences were not associated with corresponding taste sensitivities.

~~Taste Sensitivity and Taste Preference Measures Are ...~~

A simple measure of taste sensitivity can be obtained by counting the number of fungiform papillae on the tip of the tongue. The technique given here was developed by Linda Bartoshuk, Yale University. Subjects swab the tip of their tongue with a cotton swab (e.g., a Q-tip) dipped in a dilute solution of methylene blue (or blue food coloring).

~~Taste Sensitivity—an overview | ScienceDirect Topics~~

Factors affecting taste sensitivity. Fluids of extreme temperature, especially those that are cold, may produce temporary taste insensitivity. People generally seem to taste most acutely when the stimulus is at or slightly below body temperature. When the tongue and mouth are first adapted to the temperature of a taste solution, sugar sensitivity increases with temperature rise, salt and quinine sensitivity decrease, and acid sensitivity is relatively unchanged.

~~Human sensory reception—Factors affecting taste sensitivity~~

Studies On Sensitivity Of Taste And Eating Behavior Of Children and adolescents are less sensitive to sweet taste than adults, new research finds Children and teenagers require 40% more sucrose in a in a solution for them to detect the taste of sugar, a study published in journal Nutrients revealed

Studies On Sensitivity Of Taste And Eating Behavior Of While much of the research effort is focused on how the body uses and stores energy, NIDCD-supported research is uncovering valuable clues through studies on the sense of taste. Studies on Page 5/11.

~~Studies On Sensitivity Of Taste And Eating Behavior Of~~

The volatility of substances is increased at higher temperatures, and so they smell stronger. Taste bud receptivity is also an important factor. Taste buds are most receptive in the region between 68 and 86 degree F and so tastes will be more intense in this temperature range. Psychological factors also affect taste sensitivity and perception.

3. Testing validity of the taste test. We reasoned that the taste test being sensitive to experimental manipulation and associated with participant level variables that are reliably associated with food intake in other paradigms (participant sex, baseline hunger and liking of the food used in a taste test) would provide strong confirmatory evidence for the validity of the taste test.
