 $24 p = 1.01 \times 10^{5e} / 0.00012 z(2.15)$  where p is the pressure in Nm<sup>-2</sup>and z is the altitude in meters. This expression applies only with the cited units. The correct, dimensionally homogeneous form of this equation is  $p = a e^{\frac{b}{z}}$  (  $a = 1.01 \times 10^5 \text{Nm}^2$ ,  $b = 0.00012 \text{ m}^1$ ) (2.16) where a and b are physical quantities.

The Physical Basis of DIMENSIONAL ANALYSIS  
The Physical Basis Of Dimensional Bridgman (1969) explains it thus: "The principal use of dimensional analysis is to deduce from a study of the dimensions of the variables in any physical system certain limitations on the form of any possible relationship between those variables. The method is of great generality and mathematical simplicity". The Physical Basis of DIMENSIONAL ANALYSIS Is

The Physical Basis Of Dimensional Analysis Mit  
The dimension of any physical quantity, whether base or derived, is a formula that defines how the numerical value of the quantity changes when the base unit sizes are changed. The dimension of a quantity does not by itself provide any information on the quantity's intrinsic nature.

Dimensional Quantities, Dimensionless Quantities, Principle of Homogeneity. On the basis of dimension, we can classify quantities into four categories. 1. Dimensional variables. Physical quantities, which possess dimensions and have variable values are called dimensional variables. Examples are length, velocity, and acceleration etc. 2.

The Physical Basis Of Dimensional Analysis Mit  
In physics, the physical dimension of a quantity refers to the type of units that must be used to describe it. The basic construction blocks of dimensional analysis are the so-called base dimensions, this is a set of physical dimensions, which to an extent is a matter of convention, that can be used to build the physical dimension of any quantity.

 $s = ut + 1/2 at^2$ . (1) The equation contains three terms: s, ut and  $1/2at^2$ . All three terms must have the same dimensions. s: displacement = a unit of length, L. ut: velocity x time =  $LT^{-1} \times T = L$ .  $1/2at^2 =$  acceleration x time =  $LT^{-2} \times T^2 = L$ . All three terms have units of length and hence this equation is dimensionally valid.

It helps us study the nature of objects mathematically. It involves lengths and angles as well as geometrical properties such as flatness and straightness. The basic concept of dimension is that we can add and subtract only those quantities that have the same dimensions. Similarly, two physical quantities are equal if they have the same dimensions.

The Physical Basis Of Dimensional Analysis Mit  
In engineering and science, dimensional analysis is the analysis of the relationships between different physical quantities by identifying their base quantities (such as length, mass, time, and electric charge) and units of measure (such as miles vs. kilometres, or pounds vs. kilograms) and tracking these dimensions as calculations or comparisons are performed.
