Transcription and Translation. The synthesis of RNA is called transcription because it is simply the copying of DNA “ language ” into RNA. Like the transcription of spoken language into written language, the units of information (nucleotides in nucleic acids, words in speech and writing) are the same. Translation—the conversion of one language to another—is much more difficult, whether in human language or in biochemical language.

1. Transcription Study Guide. This study guide is a written version of the material you have seen presented in the transcription unit. The cell ’ s DNA contains the instructions for carrying out the work of the cell. These instructions are used by the cell ’ s protein-making machinery to create proteins. If the cell ’ s DNA were directly read by the protein-making machinery, however, it could be damaged and the process would be slow and cumbersome.

This study guide is a written version of the material you have seen presented in the replication unit. In translation, the cell uses the genetic information contained in mRNA to make the proteins that carry out the cell ’ s work. The cell translates the code contained in the mRNA into a new language, the language of proteins, based on amino acids. Other types of RNA, such as transfer RNA (tRNA) also assist in the protein-assembly process.
