In Mega-City Regions it is the management and control function, the gateway function – Munich Airport, for example – and the innovative function that play a crucial role. Analysis on its own is not enough to design sustainable residential and business areas in metropolitan environments.

### Urban Development - Fakultät für Architektur

UDM concerns the art of managing the decisions of the many stakeholders involved in the development of urban areas towards a high quality outcome—urban places to be enjoyed by all. Chaired by prof. dr. E.M. (Ellen) van Bueren, Urban Development Management is a distinct domain of research and education within the MBE department of the Faculty of Architecture and the Built Environment.

### Urban Development Management - TU Delft

Dear Readers, The city centre of Munich is in a state of constant develop- ment. The important thing is to carefully monitor the conti- nuous change in this defining central Munich reference point, to secure and expand the qualities of the city centre. That is why the aim of the urban development is to preserve the urbanity of the city with its customary mixed use as a place of commerce and culture, living and working.

This book examines a range of practical developments that are happening in education as conducted in urban settings across different scales. It contains insights that draw upon the fields of urban planning/urbanism, geography, architecture, education and pedagogy. It brings together current thinking and practical experience from German and international perspectives. This discussion is organised in four segments: schools and the neighbourhood; education and the neighbourhood; education and the city and finally, education and the region. Contributors cover a wide range of contemporary and significant socio-political aspects of education over the last decade. They reinforce emergent thinking that space and its urban context are important dimensions of education. This book also underscores the need for more research in the relationships between education and urban development itself. Current urban planning does not fully connect our understanding in education with what we know in the spatial and planning sciences. Accordingly, this release is an early attempt to bring together a growing body of integrated and interdisciplinary reflection on education theory and practice.

Chelsea Tschoerner-Budde analyzes discourse in two cases of sustainable mobility policymaking in Munich: cycling promotion and electric mobility promotion. Both cases revealed that the formation and integration of a new, socially driven discourse on everyday mobility was necessary for policy change. Historically, transport policy has been structured to improve flow and manage transport systems. The new 'everyday mobility cultures' approach presents a potential framework for improving policymaking and fostering a transition in the transport sector.

With the emphasis on market-led development initiatives, sustainable urbanization is a challenge, especially in growing nations. Regional administrative efforts are crucial for cities to meet the planned city operations and specific targets and objectives. The Handbook of Research on Urban Governance and Management in the Developing World is a research publication that explores contemporary issues in regional political and administrative practices and key challenges in implementing these strategies in growing nations. Featuring coverage on a wide range of topics such as urban and regional economics, supply chain management, and environmental concerns, this book is geared toward city development planners, policy makers, researchers, academics, and students seeking current and relevant research on the regional bureaucracy and its practices and how they affect growing nations.

Natural disasters are increasingly affecting the world, taking lives unexpectedly and leaving many others injured and homeless. Moreover, disasters disrupt local, national and even global economies, instantly changing the direction of development. In the first half of 2011 alone, 108 natural disasters occurred, killing over 23 thousand people, affecting nearly 44 million others and causing more than 253 billion US dollars of economic damages (CRED 2011.1). Large urban settlements have become increasingly vulnerable to the impacts of natural disasters. The concentration of substandard infrastructure and housing, material assets, and inherent socio-economic inequalities increase vulnerability to disasters in large urban areas, especially in developing countries. The size, number, functions, and geographical distribution of large- and megacities create a special concern for disaster risk. Good urban management practices can be a powerful catalyst for reducing losses from natural disasters, while simultaneously helping to develop a sustainable environment. Yet, the existing situation indicates that sustainable planning and risk management measures are not taken into consideration or may not be put into practice for a variety of financial, political, and social reasons. This book argues that, on one hand, socio-economic disparities resulting from unsustainable urban development can increase vulnerability to natural hazards, and on the other hand, when paired with natural hazards this increased vulnerability can negatively affect urban areas, resulting in further inequality. This book will showcase this argument with theoretical reviews and quantitative analyses on the interplay between sustainable development and disaster vulnerability as well as an in-depth case study of the role of urban planning and risk management practices in creating the socio-economic and spatial vulnerabilities and predicted earthquake risk in the megacity of Istanbul.

The Open Access version of this book, available at http://www.tandfebooks.com/doi/view/10.1201/9781315146638, has been made available under a Creative Commons Attribution-Non Commercial-No Derivatives 3.0 license. GIS is used today to better understand and solve urban problems. GIS in Sustainable Urban Planning and Management: A Global Perspective, explores and illustrates the capacity that geo-information and GIS have to inform practitioners and other participants in the processes of the planning and management of urban regions. The first part of the book addresses the concept of sustainable urban development, its different frameworks, the many ways of measuring sustainability, and its value in the urban policy arena. The second part discusses how urban planning can shape our cities, examines various spatial configurations of cities, the spread of activities, and the demands placed on different functions to achieve strategic objective. It further focuses on the recognition that urban dwellers are increasingly under threat from natural hazards and climate change. Written by authors with expertise on the applications of geo-information in urban management, this book showcases the importance of GIS in better understanding current urban challenges and provides new insights on how to apply GIS in urban planning. It illustrates through real world cases the use of GIS in analyzing and evaluating the position of disadvantaged groups and areas in cities and provides clear examples of applied GIS in urban sustainability and urban resilience. The idea of sustainable development is still very much central in the new development agenda of the United Nations, and in that sense, it is of particular importance for students from both the Global South and Global North. Professionals, researchers, and students alike will find this book to be an invaluable resource for understanding and solving problems relating to sustainable urban planning and management.

This multidisciplinary book covers all aspects of planning, designing, establishing and managing forests and trees and forests in and near urban areas, with chapters by experts in forestry, horticulture, landscape ecology, landscape architecture and even plant pathology. Beginning with historical and conceptual basics, the coverage includes policy, design, implementation and management of forestry for urban populations.

This new book explores how the professions responsible for enhancing the built environment's sustainability seek to deliver this new agenda, offering multi-perspective case studies and discussion to argue for a rethinking of the role of urban development professional. Showing how sustainability is rapidly becoming the norm for practitioners, the authors consider new types of professional knowledge, relationships between planning systems and property development, links between public and private sector organisations, ideas about long term responsibilities and new working practices for engaging with the public.

This book showcases new empirical findings on the conceptualization, design, and evaluation of land management interventions and addresses two crucial aspects: how and under which conditions such interventions are responsible, and how such interventions can be supported by smart technologies. Responsible and Smart Land Management Interventions is for all types of actors in land management. Although primarily based on cases from Africa, it addresses land management issues from practical and theoretical perspectives relevant for land managers worldwide. It brings the discourse up to date and helps all practitioners designing new policies and those looking for new instruments to do so. Aimed at land academics, including students, teachers, and researchers, as well as practitioners, including those working within international organizations, donor organizations, NGOs, and land independent consultants, this book Delivers innovative methodologies for land management for professionals involved in land administration projects Explores land management from a geodetic and spatial planning perspective Includes real cases, empirical data, and analysis in contemporary and alternative land management developments in Africa Addresses important land issues which contribute to national development and achieving United Nations' SDGs Discusses contemporary research findings related to societal needs in land administration which are equally valid for non-African contexts Acts as a new teaching resource for land management and land administration courses, and land-related disciplines in geodesy, human geography, development studies, and environmental planning

This seminal edited collection examines the impact of austerity and economic crisis on European cities. Whilst on the one hand the struggle for competitiveness has induced many European cities to invest in economic performance and attractiveness, on the other, national expenditure cuts and dominant neo-liberal paradigms have led many to retrench public intervention aimed at preserving social protection and inclusion. The impact of these transformations on social and spatial inequalities – whether occupational structures, housing solutions or working conditions – as well as on urban policy addressing these issues is traced in this exemplary piece of comparative analysis grounded in original research. Unequal Cities links existing theories and debates with newer discussions on the crisis to develop a typology of possible orientations of local government towards economic development and social cohesion. In the process, it describes the challenges and tensions facing six large European cities, representative of a variety of welfare regimes in Western Europe: Barcelona, Copenhagen, Lyon, Manchester, Milan, and Munich. It seeks to answer such key questions as: What social groups are most affected by recent urban transformations and what are the social and spatial impacts? What are the main institutional factors influencing how cities have dealt with the challenges facing them? How have local political agendas articulated the issues and what influence is still exerted by national policy? Grounded in an original urban policy analysis of the post-industrial city in Europe, the book will appeal to a wide range of social science researchers, Ph.D. and graduate students in urban science, social policy, sociology, human geography, European studies and business studies, both in Europe and internationally.

Since the 1990s 'beliefs', 'ideas' or 'knowledge' as well as processes of communicative interactions such as persuasion, argumentation and learning have received increasing attention in social science for the understanding of political changes. This book makes a significant contribution to this scholarly debate and will be of interest to practitioners, showing on one side how climate change has received more and more attention in policy making at the local level and changed the urban agenda and on the other how different the responses of cities to this global challenge are – and how these differences between cities can be explained. This book was previously published as a special issue of Urban Research and Practice.
